👤 J. Bryan Mason

★★★★☆

A great book for all scientists

Reviewed in the United States on April 20, 2000

This book, while perhaps slightly out of date in this age of ever changing computer technology, is a must for all scientists, not only archaeologists. If you strive for meaningful, accurate and consistent research, this book can lead the way.

While it can seem overbearing to readers not familiar with scientific philosophy and statistical techniques, Christopher Carr and the other authors do a great job of walking the novice through many of the unfamiliar terms and concepts.

This book should be used in teaching all archaeology students how to construct their research.

My only regret (and the reason why there are only four stars) is that it is now out of print and not being constantly updated for new editions.
